INSTALLATION GUIDE

Single Lens dashcam

Forward-facing camera for recording the road through the truck windscreen.

Connection diagram

System diagram. Obtain the model-specific wiring and connector diagrams from JaxiCloud Support before connecting the equipment.

Installation

- Choose a location near the centre of the windscreen, with the lens within the area swept by the wipers. Check from the driver's seat that the camera and bracket leave a clear view and do not obstruct the vehicle's sensors, cameras or sun visor.
- Clean and dry the glass. Fit the supplied bracket according to the kit instructions and aim the lens at the road. Keep the SIM and microSD slots accessible and route cables away from pinch points, abrasion and airbags.
- Park the vehicle securely. Connect the power box and harness using the approved diagrams for the unit and vehicle. The workshop verifies the supply, ground, ignition signal (ACC), fuse and connection points before installation.

Configuration and functional test

- Open the live image in the installer app available from JaxiCloud Support. Adjust the horizon and field of view. Check the SIM and microSD card if used. If ADAS is enabled, calibrate the forward-facing lens using the instructions for the supplied unit.
- Play back a short test recording, verify that the camera starts after an ignition cycle, and check live view in JaxiCloud if enabled.
