WORKSHOP GUIDE

Volvo FH factory display

Check and test wireless rear-camera integration with the Volvo FH side display, including the FH 500.

Connection diagram

System diagram. Obtain the model-specific wiring and connector diagrams from JaxiCloud Support before connecting the equipment.

Workshop guide

- Record the model year, VIN and infotainment package. Ask the Volvo workshop to confirm camera preparation, an available input and the video format supported by the specific truck.
- The receiver outputs AHD 1080p. Volvo describes an analogue camera option on some INFOHIGH configurations. The workshop must confirm whether the input accepts the signal or needs a converter, interface or vehicle software activation.

Configuration and functional test

- First test the signal with a compatible video input. Then test the verified setup on the factory display, checking orientation and that the driver can select the camera. Test automatic reverse-gear activation if agreed.
- Check that the correct picture returns after a restart and trailer change. Test existing camera views. Record the truck, trailer, hardware, any interface, software activation and test result.
